

Prototype an idea with the Justlife Design System

A step-by-step guide — no coding, and nothing you can break.

Describe a component you want. **Claude builds a working prototype using our real design system** and saves it as a **suggestion** for the design team to review. You never touch the live system.

WHAT YOU'LL NEED

- A **Claude account on a Pro, Max, or Team plan** (the free plan doesn't include Claude Code).
- **Write access** to our repo `justlifedesignstudio/justlife-design-system` — ask the design team. They'll add you *and* approve the Claude app for our GitHub org (a one-time admin step).

SETUP — CONNECT GITHUB (ONE TIME, ~3 MIN)

- 1 Open Claude Code**
Go to claude.ai/code and sign in with your Claude account.
- 2 Connect GitHub**
Click **Connect GitHub**. GitHub opens the Claude app page → choose **Only select repositories** → pick **justlife-design-system** → click **Install** (confirm your GitHub password / 2-factor if asked). You're sent back to Claude Code.
- 3 Create an environment** — only if it asks
Give it any name, leave everything on the defaults (network **Trusted**), and click **Create environment**.

Don't see the repo, or "access request pending"? Our repo lives in a GitHub *organization*, so an admin must approve the Claude app once. Ping the design team — they'll approve the Claude GitHub App for the `justlifedesignstudio` org and give you write access. Refresh, and the repo appears.

FOR EACH IDEA

- 4 Start a new chat**
In the **repository dropdown** under the message box, pick **justlife-design-system**. Leave the branch on **main**.
- 5 Describe what you want**
Paste this and fill in the last line with your idea:

```
You're in the Justlife design system repo. I want to propose a new component.  
Build it ONLY inside the proposals/ folder — don't change anything under  
components/ or tokens. Reuse our existing design-system components and follow  
AGENTS.md. When it's ready, run Storybook so I can click through it live (no screenshots).  
  
What I want: an "Earliest Available Slot" component for the home-cleaning  
booking flow, that shows the soonest slot in the most on-brand way.
```
- 6 Try it live & tweak**
Claude opens a **live, clickable preview** right in the session — not a screenshot. Play with the real thing and ask for changes in plain language — *"make it smaller"*, *"move the time to the right"* — the preview updates as you go, until it looks right.
- 7 Like it? Save it as a suggestion** — optional
Only if it's worth sharing: say *"Open a pull request titled Proposal: Earliest Available Slot"* (or click **Create PR** → **Open as PR**). It goes to the design team as a suggestion, with a **live preview link they can open to review it**. Nothing panned out? Just close the tab — nothing is saved, no one is bothered.

💡 **Want to see what we already have?** Browse our live Storybook — every existing component and screen — before you start: main--6a4f941f1c2dd655ffb192cb.chromatic.com

You can't break anything.

- Your work stays in a **sandbox** (the `proposals/` folder) — it can't touch real components.
- The live design system is **protected**: every change needs the design team's approval before it goes in.
- Worst case, we simply close the suggestion. Nothing is lost.
